

Magnets as enablers for renewable energy and resource efficiency

Oliver Gutfleisch

TU Darmstadt, Material Science, Functional Materials
Fraunhofer Project Group for Materials Recycling and
Resource Strategy IWKS Hanau, Germany

TECHNISCHE
UNIVERSITÄT
DARMSTADT

Our research

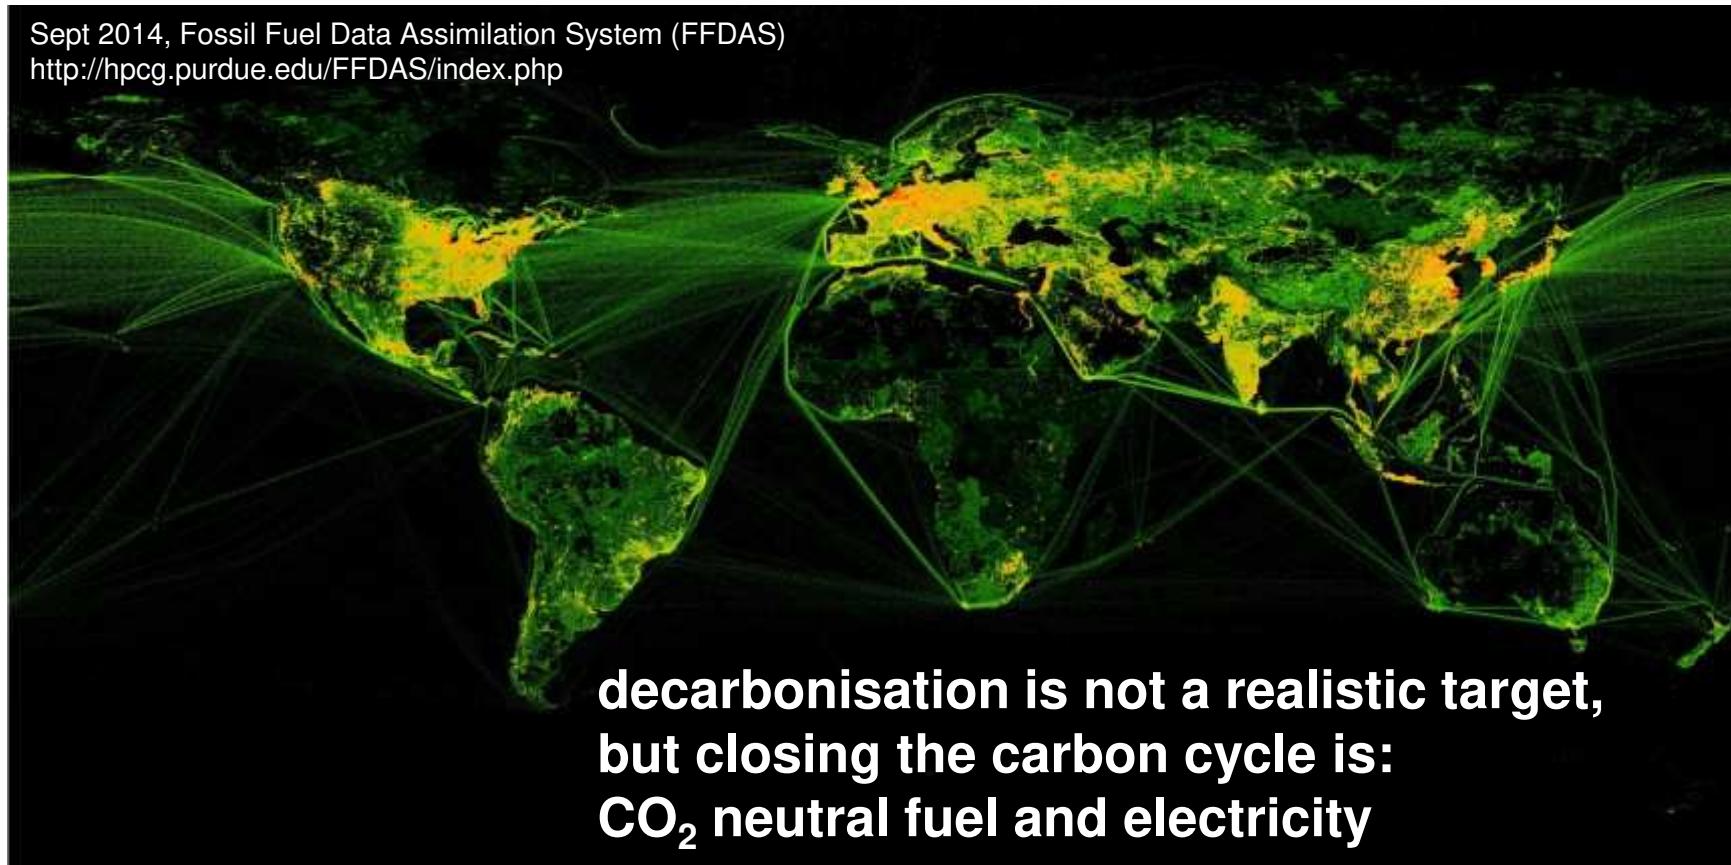

- new permanent magnets for power applications
(HREEs reduced/free → using free REEs → REE free)
- solid state energy efficient cooling (H-, p-, σ-caloric)
- ferromagnetic shape memory alloys,
magnetic nanoparticles for biomedical applications
- tailoring structural and chemical properties on the nanoscale
- development of advanced processing routes
(e.g. net-shaping or SPD combined with field-assisted processing)
- advanced characterisation
(in-situ MFM in high H and wide T; HRTEM at high T, atomprobe)
- additive manufacturing of magnets → local functionalities
- modelling across all length scales
- substitution and resource efficiency on element, process and product levels
- recycling of rare earth containing materials
- general concepts of materials criticality

Source: www.strom-report.de

We are like tenant farmers chopping down the fence around our house for fuel when we should be using nature's inexhaustible sources of energy—sun, wind and tide. I'd put my money on the sun and solar energy. What a source of power! I hope we don't have to wait until oil and coal run out before we tackle that."

NATURE | COMMENT

Renewables need a grand-challenge strategy

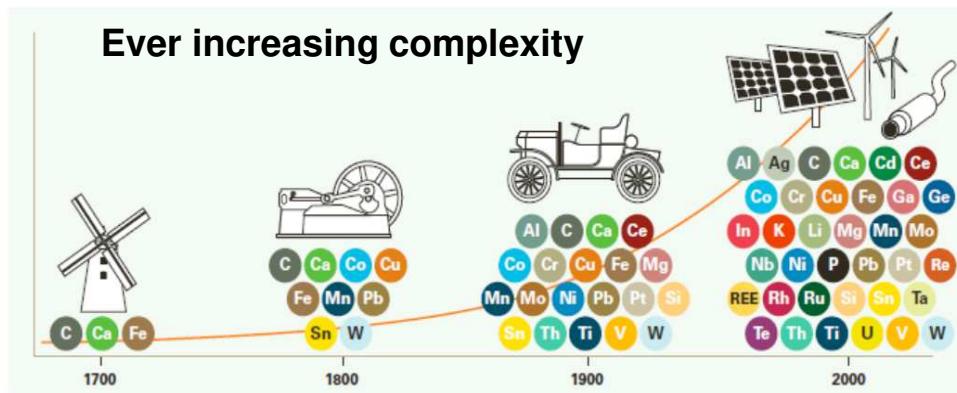

Alan Bernstein, Edward H. Sargent, Alán Aspuru-Guzik, Richard Cogdell,
Graham R. Fleming, Rienk Van Grondelle & Mario Molina

05 October 2016

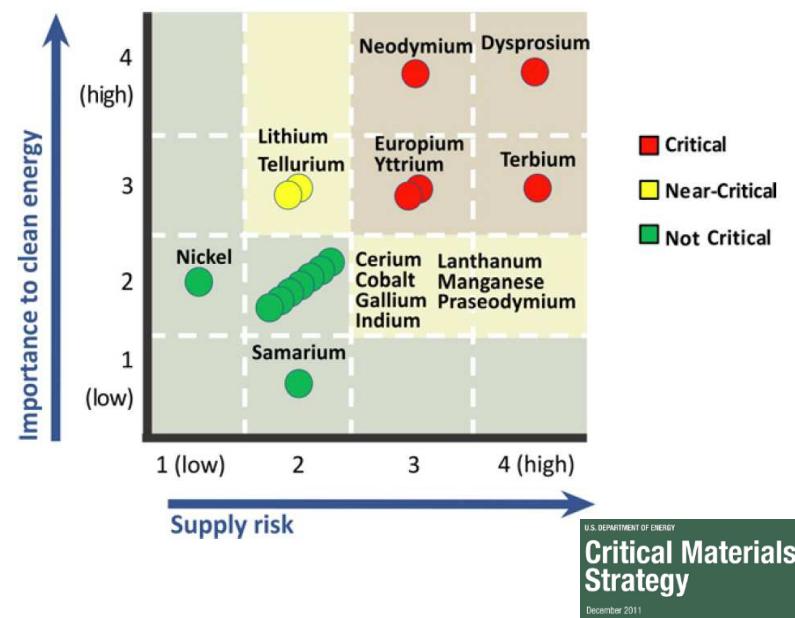

- The challenge is to produce **large- and small-scale energy storage and conversion systems** that are scalable, inexpensive, flexible and easy to disseminate.
- Utilisation of **earth-abundant materials** for batteries, electrolytes, catalysts, fuel cells, sensors, actuators, motors and generators.
- Any system must be safe and sustainable, competitive and compatible with energy generation and distribution systems.
- Public policies to encourage the development of disruptive innovations to displace existing technologies.

- Light and heavy rare earths
- lighter RE are more incompatible (as they have larger ionic radii) and therefore more strongly concentrated in the continental crust than the heavier RE
- RE with even atomic numbers (58Ce, 60Nd, ...) have terrestrial abundances than adjacent RE with odd atomic numbers (57La, 59Pr, ...)

Abundance of elements in the Earth crust per million of Si atoms

TECHNISCHE
UNIVERSITÄT
DARMSTADT

Abundance of the chemical elements in Earth's upper continental crust

- (1) **Rock-forming elements** (major elements in green field and minor elements in light green field);
- (2) **Rare earth elements** (lanthanides, La–Lu, and Y; labeled in blue);
- (3) **Major industrial metals** (global production $>\sim 3 \times 10^7$ kg/year; labeled in red);
- (4) **Precious metals** (purple);
- (5) **The nine rarest “metals”**—the six platinum group elements plus Au, Re, and Te (a metalloid).

Rare earth crisis

was not only predictable, it was also preventable

TECHNISCHE
UNIVERSITÄT
DARMSTADT

- The USGS estimates proven reserves of REEs at 800 times of current demand.
- The technologies for mining, beneficiation and separation of REE are available outside China.
- With an adequate, one-off investment, REE supply could have been diversified and supply security been guaranteed.
- A single REE mine is likely to meet all of Europe's current rare earth requirements, and a handful of mines could meet the world's demand outside of China.

The size of the spots correlates with the amount of energy spent for **domestic refrigeration** in each country per year (estimates for the years 2013/2014).

Gauss and Gutfleisch, *The resource basis of magnetic refrigeration*, J. of Industrial Ecology, 2016.

China - the factory of the world - I

In 2015, it produced or assembled:

- 28% of the world's automobiles
- 41% of the world's ships
- 80%+ of the world's computers
- 90%+ of the world's mobile phones
- 60% of the world's colour TV sets
- 50%+ of the world's refrigerators
- 80% of the world's air-conditioners
- 24% of the world's power
- Half of the world's steel

strategy targets are all high-tech industries:

- Automotive
- Aviation
- Machinery
- Robotics
- high-tech maritime
- railway equipment
- energy-saving vehicles
- medical devices
- information technology

The demand for Nd-Fe-B by different applications in 2015

K.-H. Müller, S. Sawatzki, R. Gauss and O. Gutfleisch,
Permanent magnetism,
in Springer Handbook of Magnetism,
ed. by J.M.C. Coey and S. Parkin, in preparation.

Permanent Magnet Growth

- World production of sintered NdFeB in 2012: ~100.000 t (estimated 80% China, ~18%Japan, 2%Europe)
- The motor/generator in a hybrid electric vehicle contains **1 kg of NdFeB**. Set to grow to between 10 million and 20 million vehicles by 2018.
- New designs of wind generators use NdFeB magnets at **a rate of ~600 kg per mega-watt**. This application alone has potential to increase RE demand by 25% per year above current production.
- Hard disc drives cannot function without RE permanent magnets. Formerly 70% of the NdFeB market this is now diluted by the other major applications.
- Solid state energy efficient cooling: **Magnetocalorics 1kg MCE and 4 kg NdFeB per kilo-watt cooling power**

Adv. Mat. (Review) 23 (2011) 821

Towards high-performance permanent magnets without rare earths

M D Kuz'min¹, K P Skokov¹, H Jian¹, I Radulov¹ and O Gutfleisch^{1,2}

- Achieving a very strong magnetic anisotropy in a 3d material is a difficult, but not an impossible task.
- It is difficult because there is no general recipe (necessary condition) for a strong anisotropy in a band magnet.
 - **Induced non-cubicity**
 - **Volume expansion**
 - **3d–5d binaries**
 - **Searching for new compounds**

Ways of enhancing magnetocrystalline anisotropy in 3d magnets:

TECHNISCHE
UNIVERSITÄT
DARMSTADT

- 1. Induced non-cubicity**
- 2. Volume expansion**
- 3. 3d–5d binaries**
- 4. Searching for new compounds**

Avoidance of cubic structures is a general principle of searching for strongly anisotropic magnetic materials.

Bcc Permendur is unsuitable for permanent magnet applications. Fe–Co alloys are of interest, provided the lattice symmetry is artificially reduced to e.g. tetragonal. As a more general case one can regard the body centered tetragonal lattice, the so-called tetragonal Bain path.

The shape of such a lattice is described by a single parameter — the aspect ratio a/c . There are two special cases corresponding to the cubic symmetry: $a/c=1$ (body centered cubic) and $a/c = \sqrt{2}$ (face centered cubic).

The second-order anisotropy energy must vanish at both points. Therefore, there should be a maximum in between, at $a/c \sim 1.2$.

Magnetic refrigeration

From fundamentals to application

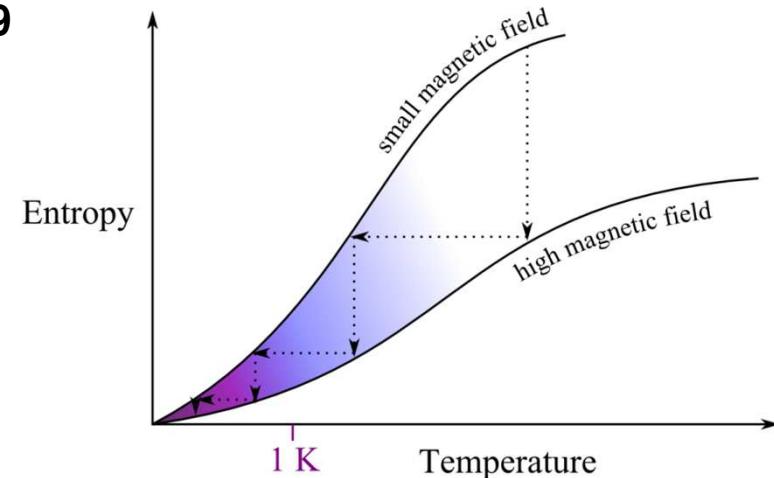

Magnetocaloric refrigeration

TECHNISCHE
UNIVERSITÄT
DARMSTADT

- First described in 1917 by P. Weiss
- Used to reach temperatures below 1 K
→ Nobel Prize for Chemistry 1949
- Todays objective:
Magnetic refrigeration close to room temperature
- 20% of worldwide consumption of electricity caused by refrigeration and air-conditioning

Magnetic refrigeration as an alternative ?

Potentially higher efficiency than conventional technology but still many problems to be solved

COMPARISON OF COOLING TECHNOLOGIES

Technology	Conventional gas compression	Gas absorption	“Peltier” electric coolers	Thermoacoustic coolers	Magnetic cooling engine
Change of state	Liquid↔Gas	Liquid↔Gas	Electron↔Hole states	High pressure gas↔Low pressure gas	Different magnetic states
Max. efficiency	45%²	30% ³	<10% ⁴	40% ⁵	60%⁶

The **specific entropy s** in a magnetocaloric material is a combination of

- specific magnetic entropy $s^{(m)}$,
- specific lattice subsystem entropy $s^{(l)}$ and
- specific entropy of the conduction electrons $s^{(e)}$.

If we consider s as a function of T and H_0 , it follows:

$$s(T, H_0) = s^{(m)}(T, H_0) + s^{(l)}(T, H_0) + s^{(e)}(T, H_0)$$

Magnetocaloric effect

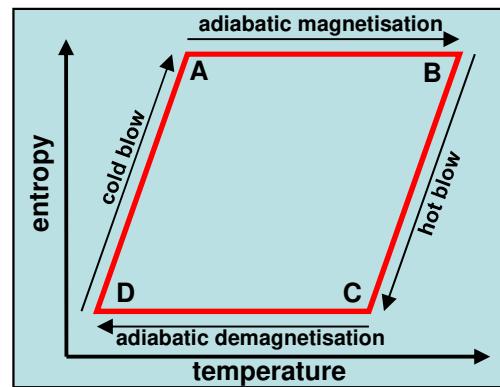

- Maxwell equation applies to equilibrium thermodynamics
- coupled magnetostructural transitions, related latent heat, hysteresis
- $\Delta S_{iso} = \Delta S_{mag} + \Delta S_{lat} + \Delta S_{el}$

$\Delta\mu_0 H$:	1.1 T
Mass of magnet:	3.9 kg
Active Volume:	63.6 cm ³
Frequency:	up to 5 Hz
Fluid:	water
Temperature span:	26 K
Gd mass:	76 g
Sphere diameter:	250-355 µm

- ❖ Use of **recycled** Nd₂Fe₁₄B
- ❖ Less permanent magnet mass
- ❖ 124% higher active volume
- ❖ 18% higher magnetic field change
- ❖ 50% lower torque → smaller motor
- ❖ Less heating of magnets
- ❖ 50% higher maximum thermal span

Permanent magnet assemblies

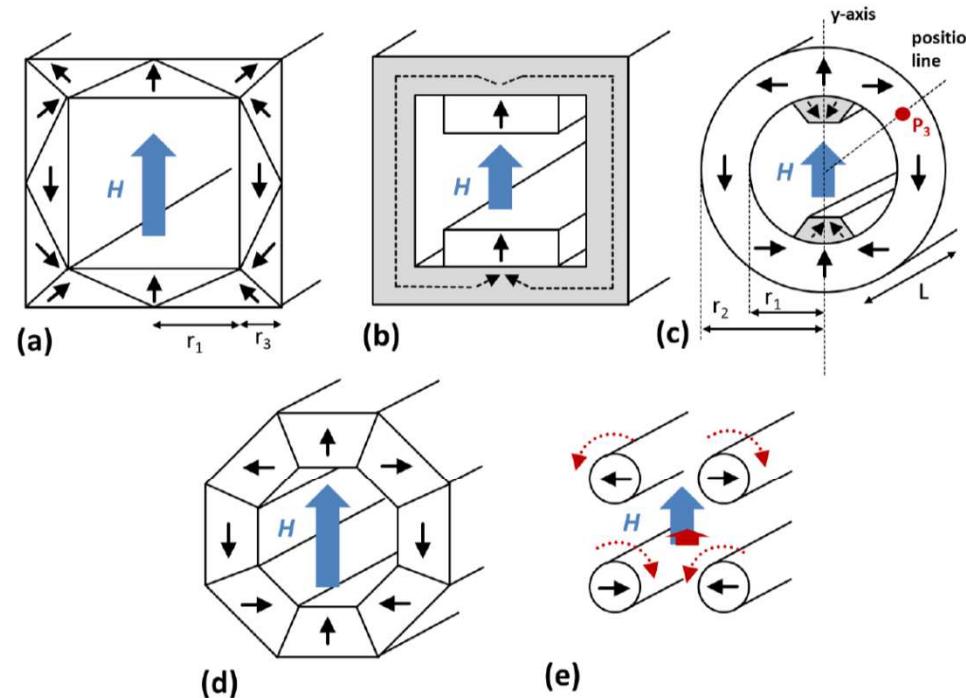

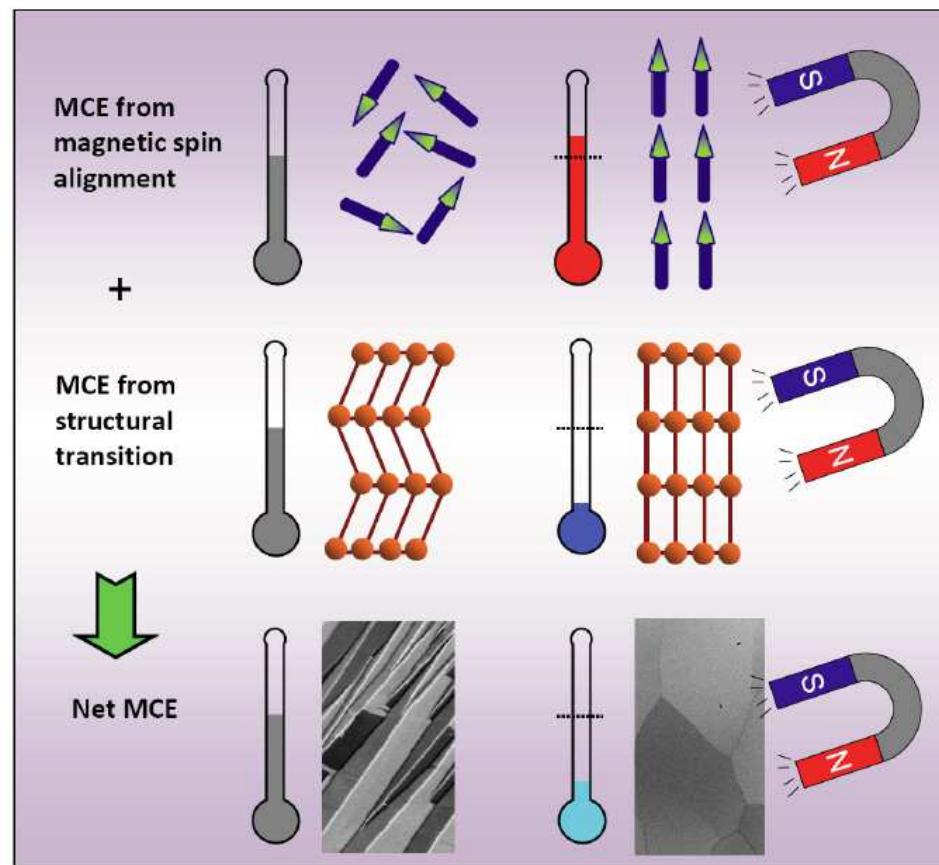

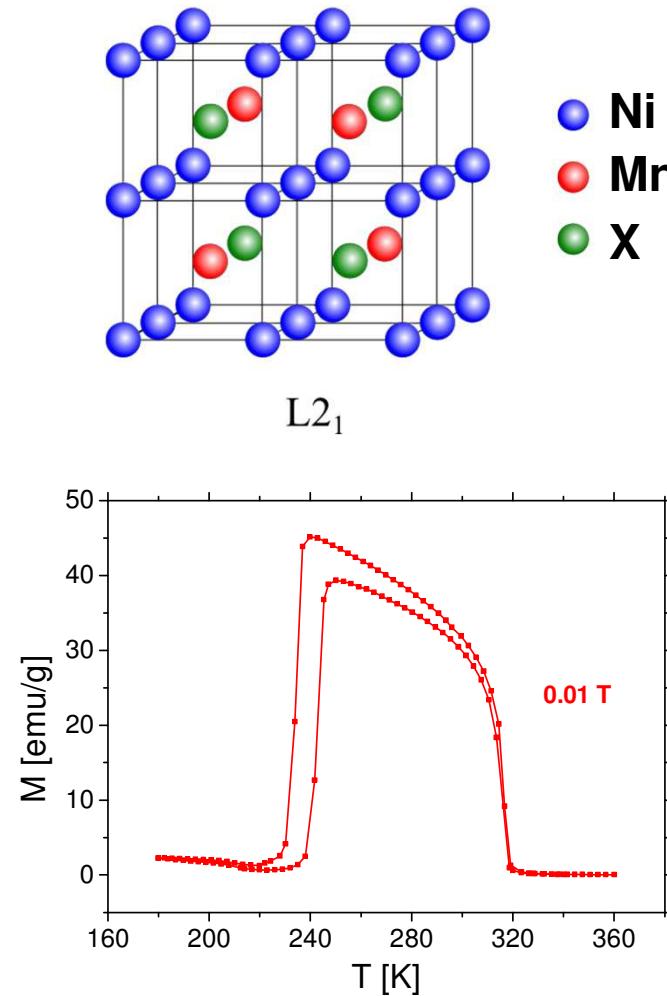

Fig. 27. Cross sections of some permanent magnet assemblies which create a uniform magnetic field along the blue arrows (a) from wedge segments, (b) with soft iron return path, (c) from Halbach array with soft iron pole-shoes (d) from segmented Halbach array, and (e) from a magnetic mangle, respectively, modified after [196]. The black solid and the black dashed arrows indicate the direction of magnetization in the permanent magnet as well as in the soft iron. The red dotted arrows show the sense of rotation

Advanced Functional Material, in press

Conclusions

- ❖ Post-fossil society is not possible without rare metals
- ❖ REPM based motors are the best technological solution
- ❖ big demands in E-mobility, wind turbines, maybe magnetic refrigeration are still to come
- ❖ currently no equivalent substitutes for Nd-Fe-B magnets in many applications; a new RE free PM would be technologically disruptive
- ❖ RE balance needs to be explored, utilisation of free rare earths
- ❖ environmental indicators of a product would be drastically improved if recycled REPMs were used → magnetic refrigeration
- ❖ FORWARD by high through-put modelling → materials database → rational synthesis → advanced characterisation → identification of replacement material (earth abundant materials)
